Skabo field pads, Williams and Divide counties, North Dakota: a first sizing

What this gas could power, how much land it would take, and what it could earn each year.

3.4 MW	3	9 ac	252k
POWER FROM THE GAS	COMPUTE MODULES	LAND NEEDED	MMBTU BOUGHT / YR

GAS SALE, PER YEAR	LAND LEASE, PER YEAR	TOTAL TO THE OWNER, PER YEAR
up to $189k	$9k to $18k	$9k to $207k

YOUR SITE IN OUR LIVE 3D MODEL — ACCRETIONCOMPUTE.COM/SITE-MODEL?SRC=GAS&FLOW=0.7

THE MATH

Methane in 1.2 MMcf/d flared (low case)	0.7 MMcf/d
Energy in the gas	30.2 MMBtu per hour
Power at a heat rate of 9,000 Btu/kWh	about 3.4 MW
Compute (power less cooling and losses, /1.2)	about 2.8 MW
Compute modules (about 1 MW each)	3
Gas engines (running plus one spare)	3 at 2.5 MW
Land: 5 acres plus 1.2 acres per MW	about 9 acres
Gas bought per year (95% run time)	252k MMBtu
Gas payment, up to $0.75/MMBtu	up to $189k
Land lease at $1,000 to $2,000 per acre per year	$9k to $18k

Methane only: 1.2 MMcf/d of rich flared gas at about 60% methane, shown as 0.70 MMcf/d of pipeline-quality gas. Heavier gases are not counted. Prices in US dollars.

WHAT IT WOULD LOOK LIKE

- Gas engines on a small parcel near the gas, a battery to smooth the load, and factory-built compute modules leased to an AI company.
- No grid connection and no export: all of the power is used on site.
- We build and run the site. The owner puts in no capital.
- Multi-year gas and land agreements, matched to the tenant's lease, at a fixed price.

WORTH CHECKING

- Volume the owner could sell at the pads, and its forecast
- Any gathering hookup planned for the flared share
- A small fenced parcel near the pads

Source: North Dakota DMR, August 2026: the three pads flared 3.03 MMcf/d, down about 7% a month. Low case 1.2 MMcf/d, about where that decline leads by mid-2027, at about 60% methane, counting the methane only. This is a first read from public data, not an offer: no cost and no obligation. The real price and terms are set in the gas and land agreements after a site review.
